NEW ENERGY OUTLOOK 2015

**Seb
Henbest**

Lead Author

Seb is responsible for managing the production process, defining the report structure and extracting the most powerful findings and trends.

**Elena
Giannakopoulou**

Lead Energy Economist

Elena is responsible for coordinating input from around the world, model development and data analysis.

The New Energy Outlook is Bloomberg New Energy Finance's annual long-term forecast for the global power sector. Drawing on the expertise of over 90 technology, economics and policy specialists around the world, these six reports capture our best assessment of how energy markets will evolve over the next 25 years.

“Prediction is difficult,
especially about the
future”

– Niels Bohr

1.

Renewables will command just under 60% of the 9,786GW of new capacity and 65% of the \$12.2 trillion of power investment to 2040.

2.

Economics – rather than policy – will increasingly drive the uptake of renewable technologies.

3.

The real solar revolution will be on rooftops, driven by high retail prices, and the availability of residential storage in some countries.

4.

In developed economies, the link between economic growth and electricity consumption appears to be weakening and daily load profiles are getting 'peakier'.

5.

Gas' role as a 'transitional fuel' is in question as less than 1,000GW of net capacity will be added globally by 2040.

6.

Despite significant growth in renewables, fossil fuels will maintain a 44% share of generation in 2040 when CO₂ emissions will be 13% higher than today.

GLOBAL (EX. CHINA) ONSHORE WIND CAPACITY FACTOR IMPROVEMENT OVER YEARS, 1997-2015 (%)

Note: We calculate the capacity factor with our proprietary [Wind Farm Capacity Factor Tool](#) using wind resource data provided by 3TIER by Vaisala. We assume P90 value in the capacity factor tool.

Source: Bloomberg New Energy Finance

ONSHORE WIND EXPERIENCE CURVE, 1985-2015 (2014 EUR/MWH, MW)

Note: Pricing data has been inflation corrected to 2014. We assume the debt ratio of 70%, cost of debt (bps to LIBOR) of 175, cost of equity of 8%. H1 2015 average LCOE data refers to [H1 2015 Wind Levelised cost of electricity update](#). We convert US dollar to Euro based on the exchange rate of 0.8979 (exchange rate on 30 July 2015). Learning curve is least square regression: $R^2 = 0.91$ and learning rate=19%
